: (1) Prosthodontics enjoys the honor of being the largest and probably the oldest discipline in the whole of dentistry. The technical importance of the subject may be understood by the fact that it is the only subject in the dental professional curriculum that is taught at the undergraduate (BDS) level from 1 year to the final year of the curriculum with maximum number of teaching hours devoted to it. The teeth are being extracted and being replaced by artificial teeth since a very long time. This may be some or all of the teeth. The complete dentures form one of the most important fields of Prosthodontics as this deals with majorly the restoration of the function of the patient. Thus a successful Prosthodontic treatment is a boon especially to the elderly section of our society which usually gets cutoff from the main stream of the social structure owing to their physical weakness and mental frustration which creates a vicious circle in the minds of these gentle people. Once restored to proper health and good oral functions, a tremendous boost of confidence is appreciated in such patients as they begin to re-enjoy their life and in a sense begin to re-live it. It basically covers all of the associated aspects of complete dentures also giving an insight into the Prosthodontic viewpoint of the maxillofacial prosthetics and the implant dentistry, hence encompassing the major part of complete dentures and to that the latest trends.

It addresses both the behavioral and clinical aspects of diagnosis and treatment and covers treatment modalities including osseointegration, overdentures, implant-supported fixed prosthesis, and the current and future directions of implant prosthodontics. Expanded coverage of implant prosthodontics addresses the clinical protocols for implant-retained and implant-supported prosthodontic management. Specific chapters address the three surfaces of the complete denture: (1) an impression or intaglio surface, (2) a polished surface, and (3) an occlusal

surface, the integration of which is crucial to creating a stable, functional, and esthetic result. Chapter on health and nutrition examines a number of systemic conditions (vesciculoerosive conditions, systemic lupus erythematosus, burning mouth syndrome, salivary dysfunction, Sjögren's syndrome, hyper/hyposalivation, diabetes) that affect the oral cavity and specifically influence the prognosis for wearing complete dentures or for accepting osseointegrated protheses. Chapter on the time-dependent changes which occur in the oral cavity focuses on both time-related direct (ulcer/cheek biting, irritation hyperplasia, denture stomatitis, flabby ridge and pendulous maxillary tuberosities, hyperkeratosis and oral cancer, residual ridge reduction) and indirect (atrophy of masticatory muscles, nutritional status and masticatory function, control of sequelae) changes in the oral environment, and provides strategies to minimize the risk of such changes. Chapter on the techniques used to prolong the life of complete dentures focuses on the two techniques used to extend the life of dentures: relining and rebasing, also touching on denture duplication. Well-respected editors and contributors are the leaders in their field, lending credibility and experience to each topic.
