Healthcare leaders are facing major change in how healthcare is delivered as we move from fee-for-service payment models to pay for value. Physicians and hospitals are evolving from separate financial entities (with relationships varying from customers/workshops to competitors) to unified systems. Government policy maker, payers, and hordes of consultants advise hospitals to increase physician leadership in all parts of the system. However, few have proposed how this can be done when the gaps between hospitals and physicians are so wide. Physicians do not trust healthcare leaders, lack leadership and teamwork skills, and have little knowledge of how systems work. Some hospital leaders are working to overcome these gaps by setting up dyad leadership teams, consisting of a physician and an experienced manager/leader. The physician member of the team helps with the first gap; the nurse or other dyad partner is important to manage the other gaps. Until now, with the publication of *Dyad Clinical Leadership*, there has not been a source to help clinical dyad partners learn and understand how to work together in this emerging management model. Kathleen D. Sanford, DBA, RN, CENP, FACHE, Senior Vice President and Chief Nursing Officer at Catholic Health Initiatives (CHI), builds on CHI's success with this unique playbook for the model.

In the United States, health care devices, technologies, and practices are rapidly moving into the home. The factors driving this migration include the costs of health care, the growing numbers of older adults, the increasing prevalence of chronic conditions and diseases and improved survival rates for people with those conditions and diseases, and a wide range of technological innovations. The health care that results varies considerably in its safety, effectiveness, and efficiency, as well as in its quality and cost. *Health Care Comes Home* reviews the state of current knowledge and practice about many aspects of health care in residential settings and explores the short- and long-term

effects of emerging trends and technologies. By evaluating existing systems, the book identifies design problems and imbalances between technological system demands and the capabilities of users. *Health Care Comes Home* recommends critical steps to improve health care in the home. The book's recommendations cover the regulation of health care technologies, proper training and preparation for people who provide in-home care, and how existing housing can be modified and new accessible housing can be better designed for residential health care. The book also identifies knowledge gaps in the field and how these can be addressed through research and development initiatives. *Health Care Comes Home* lays the foundation for the integration of human health factors with the design and implementation of home health care devices, technologies, and practices. The book describes ways in which the Agency for Healthcare Research and Quality (AHRQ), the U.S. Food and Drug Administration (FDA), and federal housing agencies can collaborate to improve the quality of health care at home. It is also a valuable resource for residential health care providers and caregivers.

For many years, there has been a great deal of work done on chronic congestive heart failure while acute heart failure has been considered a difficult to handle and hopeless syndrome. However, in recent years acute heart failure has become a growing area of study and this is the first book to cover extensively the diagnosis and management of this complex condition. The book reflects the considerable amounts of new data reported and many new concepts which have been proposed in the last 3-4 years looking at the epidemiology, diagnostic and treatment of acute heart failure.

It provides enough detailed and specific information to address most all questions and problems that arise in the ICU. Emphasis on fundamental principles in the text should

prove useful for patient care outside the ICU as well. New chapters in this edition include hyperthermia and hypothermia syndromes; infection control in the ICU; and severe airflow obstruction. Sections have been reorganized and consolidated when appropriate to reinforce concepts.

Acute Pain brings coverage of this diverse area together in a single comprehensive clinical reference, from the basic mechanisms underlying the development of acute pain, to the various treatments that can be applied to control it in different clinical settings. Much expanded in this second edition, the volume reflects the huge advances that continue to be made in acute pain management. Part One examines the basic aspects of acute pain and its management, including applied physiology and development neurobiology, the drugs commonly used in therapy, assessment, measurement and history-taking, post-operative pain management and its relationship to outcome, and preventive analgesia. Part Two reviews the techniques used for the management of acute pain. Methods of drug delivery and non-pharmacological treatments including psychological therapies in adults and children and transcutaneous electrical nerve stimulation are considered here. Part Three looks at the many clinical situations in which acute pain can arise, and the methods of treatment that may be suitable in each circumstance, whether the patient is young or old, has pain due to surgery, trauma, medical illness or childbirth, or is undergoing rehabilitation. Issues specific to the management of acute pain in the developing world are also covered here.

A poignant, witty memoir of learning to cope with a frightening genetic disease—and of a life transformed thanks to an organ donor. When Allison Watson awoke that day, she knew she was in a hospital bed. That's all. She had no idea how much time had passed since she'd seen her family. When she tried to focus, her vision was blurry, and when she tried to wave someone down, she became so exhausted she thought she was dying. Hours later, when Watson was able to communicate, she asked a nurse if the news was good or bad. "It's good news," the nurse replied. "You had your lung transplant four days ago." Many cystic fibrosis patients are living longer today, thanks, in part, to transplants—though they are not easy to obtain. In this candid memoir, Watson describes living under the shadow of this incurable disease; her special bond with her sister, Amy, who also grew up with CF; and her life-altering surgery in Toronto in 2014. ; the r. Nor was the road to full recovery. In this book, Watson, who cycled across Canada with her brother in 2008 to raise awareness of CF, describes her journey. "Watson tells her resilient story of living with cystic fibrosis (CF), her progressive lung damage, the stress of waiting for an organ donor, her lifesaving transplant and life in the almost five years since her major surgery." —The Guardian (Prince Edward Island, Canada)

In the past two decades, pain research has become one of the most rapidly growing areas of neuroscience activity. *Methods in Pain Research* brings together in a single volume a survey of the methods that can be used to study a reaction or 'sensory report' in humans that can only be inferred by indirect means in animal or tissues studies. It presents source material, useful advice, and guidance to specific details as well as examples of current usage. With each topic presented by one or more of the leading experts in the field, it examines the major modern techniques used in studying pain, including gene linkage, brain imaging methods, the use of transgenic rodent models, painful sensory neuropathy models, and more. The material also covers conventional methods of pain study, such as anatomical and electrophysiological techniques. *Methods in Pain Research* provides up-to-date methodology and a guide to the strategies of experimental design.

This open access book about the Zadeh Project demonstrates and explores a core question in clinical ethics: how can ethics consultants be accountable in the face of a robust plurality of ethical standpoints, especially those that underwrite practices and methods for doing ethics consultation as well as those viewpoints and values encountered in daily clinical ethics practice? Underscoring this question is the recognition that the field of clinical ethics consultation has arrived at a crucial point in its maturation. Many efforts are underway to more formally "professionalize" the field, with most aimed toward stabilizing a specific set of institutional considerations. Stretched between these institutional and practical initiatives resides a crucial set of

of ethical considerations, chief among them the meaning and scope of responsibility for clinical ethics consultants. Developed around a long-form case scenario, the Zadeh Project provides a multi-layered series of “peer-reviews”: critique of the actions of the case scenario’s ethics consultant; reflection on clinical ethics method; examination of the many ways that commitments to method and practice can, and do, intersect, overlap, and alter one another. The design and format of this book thus models a key element for clinical ethics practice: the need and ability to provide careful and thoughtful explanation of core moral considerations that emerge among diverse standpoints. Specifically designed for those studying to become and those who are ethics consultants, this book, with its innovative and multi-layered approach, allows readers to share a peer-review-like experience that shows accountability to be what it is, an ethical, not merely procedural or administrative, undertaking.

Protecting 18 million United States health care workers from infectious agents - known and unknown - involves a range of occupational safety and health measures that include identifying and using appropriate protective equipment. The 2009 H1N1 influenza pandemic and the 2014 Ebola virus outbreak in West Africa have called raised questions about how best to ensure appropriate and effective use of different kinds of personal protective equipment such as respirators, not only to promote occupational safety but also to reduce disease transmission. *The Use and Effectiveness of Powered Air Purifying Respirators in Health Care* is the summary of a workshop convened by the Institute of Medicine Standing Committee on Personal Protective Equipment for Workplace Safety and Health to explore the current state of practices and research related to powered air purifying respirator (PAPRs) and potential updates to performance requirements. Presentations and discussions highlighted current

health care practices using PAPRs and outlined the research to date on the use and effectiveness of PAPRs in health care settings with a focus on the performance requirements. *The Use and Effectiveness of Powered Air Purifying Respirators in Health Care* focuses on efficacy, current training, maintenance, supplies, and possible enhancements and barriers to use in inpatient, clinic, nursing home, and community (home) settings. This report also explores the strengths and weaknesses of using various approaches to health care PAPER standards.

This open access book focuses on practical clinical problems that are frequently encountered in stroke rehabilitation. Consequences of diseases, e.g. impairments and activity limitations, are addressed in rehabilitation with the overall goal to reduce

disability and promote participation. Based on the available best external evidence, clinical pathways are described for stroke rehabilitation bridging the gap between clinical evidence and clinical decision-making. The clinical pathways answer the questions which rehabilitation treatment options are beneficial to overcome specific impairment constellations and activity limitations and are well acceptable to stroke survivors, as well as when and in which settings to provide rehabilitation over the course of recovery post stroke. Each chapter starts with a description of the clinical problem encountered. This is followed by a systematic, but concise review of the evidence (RCTs, systematic reviews and meta-analyses) that is relevant for clinical decision-making, and comments on assessment, therapy (training, technology, medication), and the use of technical aids as appropriate. Based on these summaries, clinical algorithms / pathways are provided and the main clinical-decision situations are portrayed. The book is invaluable for all neurorehabilitation team members, clinicians, nurses, and therapists in neurology, physical medicine and rehabilitation, and related fields. It is a World Federation for NeuroRehabilitation (WFNR) educational initiative, bridging the gap between the rapidly expanding clinical research in stroke rehabilitation and clinical practice across societies and continents. It can be used for both clinical decision-making for individuals and as well as clinical background knowledge for stroke rehabilitation service development initiatives.
