Will the AIDS epidemic have similar
dramatic effects on the social and
political landscape of the twenty-first
century? This readable volume looks at
the impact of AIDS since its emergence
and suggests its effects in the next
decade, when a million or more
Americans will likely die of the disease.
The Social Impact of AIDS in the United
States addresses some of the most
sensitive and controversial issues in the
public debate over AIDS. This landmark
book explores how AIDS has affected

fundamental policies and practices in our major institutions, examining How America's major religious organizations have dealt with sometimes conflicting values: the imperative of care for the sick versus traditional views of homosexuality and drug use. Hotly debated public health measures, such as HIV antibody testing and screening, tracing of sexual contacts, and quarantine. The potential risk of HIV infection to and from health care workers. How AIDS activists have brought about major change in the way new drugs are brought to the marketplace. The impact of AIDS on community-based organizations, from volunteers caring for individuals to the highly political ACT-UP organization. Coping with HIV infection in prisons. Two

case studies shed light on HIV and the family relationship. One reports on some efforts to gain legal recognition for nonmarital relationships, and the other examines foster care programs for newborns with the HIV virus. A case study of New York City details how selected institutions interact to give what may be a picture of AIDS in the future. This clear and comprehensive presentation will be of interest to anyone concerned about AIDS and its impact on the country: health professionals, sociologists, psychologists, advocates for at-risk populations, and interested individuals.

Screening for Human Immunodeficiency Virus Regnery Publishing

During the two years since the publication of the first edition of this

book, the global spread of human immunodeficiency virus/acquired immunodeficiency syndrome (HIV/AIDS) has continued. HIV was estimated by the World Health Organization (WHO) in 1993 to have at least 13 million individuals worldwide, with 1 million infected in the United States. HIV/AIDS in the United States has become the leading cause of death among men 25 to 44 years of age and the fifth leading cause of death among women of the same age group. Prevention of HIV infection remains a global challenge. Testing for HIV is the cornerstone for surveillance and prevention programs and for the provision of appropriate medical care for those who are infected. Such testing is equally essential to the search for

effective antiviral drugs and vaccines. This second edition of *AIDS Testing* incorporates the most current thinking on test methodology and interpretation, some of which has changed considerably over the past two years. This edition also has been expanded to include a section consisting of six chapters on test applications and a section consisting of four chapters on management issues. This edition, like the first, describes in clear terms all the complex elements of testing, including applications, scientific principles, quality assurance, safety, and medical, ethical, and legal considerations.

Sexually Transmitted Diseases Oxford University Press

The anthrax incidents following the 9/11 terrorist attacks put the spotlight on the nation's public health agencies, placing it under an unprecedented scrutiny that added new dimensions to the complex issues considered in this report. The Future of the Public's Health in the 21st Century reaffirms the vision of Healthy People 2010, and outlines a systems approach to assuring the nation's health in practice, research, and policy. This approach focuses on joining the unique resources and perspectives of diverse sectors and entities and challenges

these groups to work in a concerted, strategic way to promote and protect the public's health. Focusing on diverse partnerships as the framework for public health, the book discusses: The need for a shift from an individual to a population-based approach in practice, research, policy, and community engagement. The status of the governmental public health infrastructure and what needs to be improved, including its interface with the health care delivery system. The roles nongovernment actors, such as academia, business, local communities and the media can play in creating a healthy nation. Providing an accessible analysis, this book will be important to public health policy-makers and practitioners, business and community leaders, health advocates, educators

and journalists.

Morbidity and Mortality Weekly Report
Macmillan

This report updates an evidence synthesis commissioned by the U.S. Preventive Services Task Force (USPSTF) and completed in March 2005, on screening for unsuspected human immunodeficiency virus (HIV) using HIV antibody (Ab) tests in non-pregnant adolescents (aged 13 to 18 years old) and adults. This brief update was requested by the USPSTF to determine whether there is sufficient new evidence to justify revision of recommendations

based on the 2005 evidence synthesis. A key reason for this update is the release in September 2006 of revised Centers for Disease Control and Prevention (CDC) recommendations advising routine voluntary HIV screening of most U.S. adolescents and adults. The 2005 USPSTF recommendations differ from the revised CDC recommendations in that they do not recommend for or against routine screening non-pregnant adults and adolescents who do not report risk factors and are not in high-prevalence (greater than 1%) or other high-risk settings. Staff at the CDC have indicated that the agency's expanded screening recommendations are based primarily on new evidence as to the effects of HIV screening on transmission risk. This report focuses on new or “breakthrough”

evidence that could affect the 2005 USPSTF recommendations regarding routine screening of low- or average-risk adults and adolescents. This update reviews new evidence on HIV screening not included in the 2005 evidence synthesis. It focuses on evidence in non-pregnant, adults and adolescents who do not report risk factors and are evaluated in lower-prevalence (less than 1%), low-risk clinical settings (referred to in this report as 'low-risk' persons), because this is the population for which the USPSTF and the 2006 CDC recommendations are discordant. In the 2005 evidence review, we identified several key areas where additional evidence could strengthen the case for screening in low-risk populations. These include gaps in the research regarding

uncertainties about the acceptability of routine voluntary screening in low-risk persons; the yield of targeted versus universal screening and optimal methods of risk assessment in low-risk settings; the impact on test uptake and follow-up of abbreviated or streamlined counseling methods and newer testing or sampling methods; and the effects of screening on HIV transmission rates. We therefore focused on studies that could help fill in these gaps. We also evaluated new evidence on the cost-effectiveness of routine HIV screening and studies on the frequency of testing.

Implications of the Proposed Revisions DIANE Publishing

Thousands of HIV-positive women give birth every year. Further, because many pregnant women are not tested for HIV and therefore do not receive treatment, the number of children born with HIV is still unacceptably high. What can we do to eliminate this tragic and costly inheritance? In response to a congressional request, this book evaluates the extent to which state

efforts have been effective in reducing the perinatal transmission of HIV. The committee recommends that testing HIV be a routine part of prenatal care, and that health care providers notify women that HIV testing is part of the usual array of prenatal tests and that they have an opportunity to refuse the HIV test. This approach could help both reduce the number of pediatric AIDS cases and improve treatment for mothers with AIDS. Reducing the Odds will be of special interest to federal, state, and local health policymakers, prenatal care providers, maternal and child health specialists, public health practitioners,

and advocates for HIV/AIDS patients.
