One of the most important works of twentieth-century American literature, Zora Neale Hurston's beloved 1937 classic, *Their Eyes Were Watching God*, is an enduring Southern love story sparkling with wit, beauty, and heartfelt wisdom. Told in the captivating voice of a woman who refuses to live in sorrow, bitterness, fear, or foolish romantic dreams, it is the story of fair-skinned, fiercely independent Janie Crawford, and her evolving selfhood through three marriages and a life marked by poverty, trials, and purpose. A true literary wonder, Hurston's masterwork remains as relevant and affecting today as when it was first published -- perhaps the most widely read and highly regarded novel in the entire canon of African American literature.

Science, engineering, and technology permeate nearly every facet of modern life and hold the key to solving many of humanity's most pressing current and future challenges. The United States' position in the global economy is declining, in part because U.S. workers lack fundamental knowledge in these fields. To address the critical issues of U.S. competitiveness and to better prepare the workforce, A Framework for K-12 Science Education proposes a new approach to K-12 science education that will capture students' interest and provide them with the necessary

foundational knowledge in the field. A Framework for K-12 Science Education outlines a broad set of expectations for students in science and engineering in grades K-12. These expectations will inform the development of new standards for K-12 science education and, subsequently, revisions to curriculum, instruction, assessment, and professional development for educators. This book identifies three dimensions that convey the core ideas and practices around which science and engineering education in these grades should be built. These three dimensions are: crosscutting concepts that unify the study of science through their common application across science and engineering; scientific and engineering practices; and disciplinary core ideas in the physical sciences, life sciences, and earth and space sciences and for engineering, technology, and the applications of science. The overarching goal is for all high school graduates to have sufficient knowledge of science and engineering to engage in public discussions on science-related issues, be careful consumers of scientific and technical information, and enter the careers of their choice. A Framework for K-12 Science Education is the first step in a process that can inform state-level decisions and achieve a research-grounded basis for improving science instruction and learning across the country. The book will guide standards developers, teachers, curriculum designers, assessment developers, state and district science administrators, and educators who teach science in informal environments.

Biochemistry is a major new textbook designed and created specifically for briefer courses in the subject. Written by Prof. Terry Brown of the University of Manchester (author of Genomes and Gene Cloning), the book provides the necessary detail and rigour expected for these courses, but without the extraneous material found in the larger textbooks. With an increasing number of students taking a short course in biochemistry there is a growing need for a book that covers the subject concisely and succinctly. Biochemistry has been designed from the outset for these shorter courses; it is not a cut-down version of one of the larger books that dominate the market. Although it is shorter, there is no compromise in content, style and coverage. The book is attractively designed in full colour throughout with all the pedagogical features expected in a major textbook. It covers what students should be expected to know and is written in the clear and accurate writing style for which Terry Brown is widely lauded. With its competitive price and resources for adopting lecturers (all of the illustrations and diagrams from the book, and answers to the end of chapter questions), Biochemistry will become the textbook of choice for any brief biochemistry course. Concepts of Biology is designed for the single-semester introduction to biology course for non-science majors, which for many students is their only college-level science course. As such, this course represents an important opportunity for students to develop the necessary knowledge, tools, and skills to make informed decisions as they continue with their lives. Rather than being mired down with facts and vocabulary, the typical non-science major student needs information presented in a way that is easy to read and understand. Even more importantly, the content should be meaningful. Students do much better when they understand why biology is relevant to their everyday lives. For these reasons, Concepts of Biology is grounded on an evolutionary basis and includes exciting features that highlight careers in the biological sciences and everyday applications of the concepts at hand. We also strive to show the interconnectedness of topics within this extremely broad discipline. In order to meet the needs of today's instructors and students, we maintain the overall organization and coverage found in most syllabi for this course. A strength of Concepts of Biology is that instructors can customize the book, adapting it to the approach that works best in their classroom. Concepts of Biology also includes an innovative art program that incorporates critical thinking and clicker questions to help students understand--and apply--key concepts.
