Who can resist
dolphins?
They're so
smart, and
they have that
mysterious
smile. But
they're wild
animals --
possibly
friendly,
potentially
dangerous.
And only a
very few
people get a

chance to
meet them in
the wild.
Kathleen
Dudzinski is
one of them.
Dudzinski has
studied
dolphins all
over the
world.
Everywhere

try to figure
out how
dolphins
communicate.
She has

how to hunt

with a pod of

dolphins to figure out how they all know to turn at the same time. She's even built an underwater camera housing with microphones to record and study dolphin sounds in stereo. In "Meeting Dolphins," Dr. Kathleen Dudzinski, marine biologist and subject of the large-format film "Dolphins," tells her own story and the story of the dolphins she has come to know and love.

Researchers working on adult neurogenesis have focused largely on inbred laboratory rodents. While this provides a strong advantage of restricting genetic variation in the group, it also narrows our

perspective on adult neurogenesis as a biological phenomenon. Many unsolved issues and open questions cannot be resolved without the contribution of comparative studies spanning through widely different species: how did adult neurogenesis evolve, what is the link between adult neurogenesis and brain complexity, how do adult neurogenesis and animal

behavior influence each other, how does adult neurogenesis contribute to brain plasticity, cognition and, possibly, repair, and how do experimental conditions affect adult neurogenesis. The main message from the comparative approach to adult neurogenesis is that the relative exclusive focus on laboratory rodents can result in a bias on how we think about

this biological process. Critical Issues in Tourism Co-Creation Springer Nature An introduction to the world of the dolphin, including its social behavior, communication, diet, and playtime. **Encyclopedia of Marine Mammals** Harper Collins This book takes a wide-ranging and non-dogmatic view of SDG12, tackling various approaches as to how production

and consumption can provide for human well-being while minimizing destructive effects on the biophysical environment. **Undefeated** Routledge The Anatomy of Dolphins: Insights into Body Structure and Function is a precise, detailed, fully illustrated, descriptive, and functionally oriented text on the anatomy and morphology of dolphins. It focuses on a number of

delphinid species, with keynotes on important dolphin-like genera, such as the harbor porpoise. It also serves as a useful complement for expanding trends and emphases in molecular biology and genetics. The authors share their life-long expertise on marine mammals in various disciplines. Written as a team rather than being prepared as a collection of separate contributions, the result is a

uniform and comprehensive style, giving each of the different topics appropriate space. Many color figures, which use the authors' access to wide collections of unique dolphin and whale material, round out this exceptional offering to the field. Includes high-quality illustrations, drawings, halftone artwork, photographic documentation, microphotos, and tables detailing

dolphin anatomy, function, and morphology. Facilitates education and training of students of all basic research and applied sciences dedicated to marine biology and the medical care of marine mammals. Brings together the current knowledge and information on this topic, including those in obscure past or non-English publications, or scattered in short chapters in volumes

European Whales, Dolphins, and Porpoises: Marine Mammal Conservation in Practice

presents an intimate view of the workings of international conservation agreements to protect

marine mammals, detailing achievements over the last 25 years, identifying weaknesses and making recommendations that governments, scientists, marine stakeholders and the public can take to improve conservation efforts. The book is written by an experienced marine mammal scientist and award-winning conservationist, providing a unique synthesis on their status,

distribution and ecology. In addition, it presents information on various conservation threats, including fisheries by catch, contaminants, noise disturbance, plastic ingestion and climate change. This comprehensive resource will appeal to marine mammal conservationists and researchers, as well as environmental and wildlife practitioners at all levels. Offers an

accessible review on how scientists study this challenging group of mammals to gather necessary evidence for conservation action. Illustrates, with striking images, all recorded regional species, including distribution maps, key threats and specific research methods. Includes contributions from leading scientists, conservationists, and members of

government and international bodies, like IWC and UNEP. Frontiers Media SA Young readers looking for information about their favorite marine mammals will find everything they are looking for in *Dolphins!*, the latest *Animal Planet Chapter Book. Information about dolphins' anatomy, behavior, social relationships, and more offer a complete*

survey of this high-interest topic. Illustrated chapters and species profiles highlight how dolphins live, eat, and interact with each other. Did you know that the longest dolphin—at up to 30 feet—is the orca, also known as the killer whale, and that dolphins sleep with half of their brains on? More than 100 gorgeous photos showcase dolphins around the world in this memorable

book for fans of these charismatic cetaceans!

This thorough revision of the classic Encyclopedia of Marine Mammals brings this authoritative book right up-to-date. Articles describe every species in detail, based on the very latest taxonomy, and a host of biological, ecological and sociological aspects relating to marine

mammals. The latest information on the biology, ecology, anatomy, behavior and interactions with man is provided by a cast of expert authors - all presented in such detail and clarity to support both marine mammal specialists and the serious naturalist. Fully referenced throughout and with a fresh selection of the best color photographs available, the long-awaited second edition

remains at the forefront as the go-to reference on marine mammals. More than 20% NEW MATERIAL includes articles on Climate Change, Pacific White-sided Dolphins, Sociobiology, Habitat Use, Feeding Morphology and more. European Whales, Dolphins, and Porpoises Workman Publishing An amazing journey into the hidden realm of nature's sounds The natural world teems with remarkable conversations, many beyond human hearing range. Scientists are using groundbreaking digital technologies to uncover these astonishing sounds, revealing vibrant communicatio

n among our fellow creatures across the Tree of Life. At once meditative and scientific, The Sounds of Life shares fascinating and surprising stories of nonhuman sound, interweaving insights from technological innovation and traditional knowledge. We meet scientists using sound to protect and regenerate endangered species from the Great Barrier Reef to the Arctic and the Amazon.

We discover the shocking impacts of noise pollution on both animals and plants. We learn how artificial intelligence can decode nonhuman sounds, and meet the researchers building dictionaries in East African Elephant and Sperm Whalish. At the frontiers of innovation, we explore digitally mediated dialogues with bats and honeybees. Technology often distracts us from

nature, but what if it could reconnect us instead? The Sounds of Life offers hope for environmental conservation and affirms humanity's relationship with nature in the digital age. After learning about the unsuspected wonders of nature's sounds, we will never see walks outdoors in the same way again. Whale-

This is a wide-ranging book that will be of</p>	<p>relevance to anyone involved in species conservation, and provides critical perspectives on the real utility of current and emerging reproductive sciences. Understanding reproductive biology is centrally important to the way many of the world's conservation problems should be tackled. Currently the extinction problem is huge, with up to 30% of the world's fauna being</p>

expected to disappear in the next 50 years. Nevertheless, it has been estimated that the global population of animals in zoos encompasses 12,000 – 15,000 species, and we anticipate that every effort will be made to preserve these species for as long as possible, minimizing inbreeding effects and providing the best welfare standards available. Even if the reproductive

biology community cannot solve the global biodiversity crisis for all wild species, we should do our best to maintain important captive populations. Reproductive biology in this context is much more than the development of techniques for helping with too little or too much breeding. While some of the relevant techniques are useful for individual species that society might target for a

variety of reasons, whether nationalistic, cultural or practical, technical developments have to be backed up by thorough biological understanding of the background behind the problems.

The 'Aquatic Habitat Conservation in South America' Symposium occurred during the XXI Brazilian Society of Ichthyology

Meeting. The proceedings were published as a special issue in the Journal of Fish Biology (vol. 89, Number 1, June 2016). In this special issue, authors provided an analytical overview of problems faced by the conservation of fishes and aquatic habitats of South America. Habitat loss emerged as the greatest concern for all South American aquatic ecosystems, with a long list

of causes related to unsustainable development models. Based on this finding, we would like to extend this topic to other continents, different climates, fauna and flora around the world. Our goal is to provide a comprehensive and multidisciplinary overview of variables that influence flora and fauna distributions and shape their ecological interactions within aquatic ecosystems

Comparative Immunology of Marine Mammals Scholastic Inc. “[Freeman is] an excellent storyteller.” —Sports Illustrated The 1972 Miami Dolphins, under the expert leadership of legendary coach Don Shula, remain to this day the only team in the National Football League ever to enjoy a perfect season with no defeats and no ties. Now, 40 years after sports history was made, acclaimed

sports writer Mike Freeman celebrates the Dolphins' singular achievement in Undefeated. A riveting story filled with heartbreaking injuries, miraculous finishes, and tested relationships—featuring a roster of gridiron greats, including Bob Griese, Earl Morrall, Larry Csonka, Paul Warfield, Mercury Morris, Nick Buoniconti and others—Undefeated follows a underdog

team on its remarkable run: 14 regular season victories, 2 postseason wins, and a Super Bowl championship. It is a book no football fan will want to miss.

Dolphins in Trees Time Home Entertainment This book provides a thorough, up-to-date examination of conservation biology and the many supporting disciplines that comprise conservation science. In this, the Third

Edition of the highly successful Conservation Biology: Foundations, Concepts, Applications, the authors address their interdisciplinary topic as it must now be practiced and perceived in the modern world. Beginning with a concise review of the history of conservation, the authors go on to explore the interplay of conservation with genetics, demography, habitat and landscape, aquatic

environments, and ecosystem management, and the relationship of all these disciplines to ethics, economics, law, and policy. An entirely new chapter, The Anthropocene: Conservation in a Human-Dominated Nature, breaks new ground in its exploration of how conservation can be practiced in anthropogenic biomes, novel ecosystems, and urban habitats. The Third Edition includes the

popular Points of Engagement discussion questions used in earlier editions, and adds a new feature: Information Boxes, which briefly recap specific case histories described in the text. A concluding chapter offers insight into how to become a conservation professional, in both traditional and non-traditional roles. The authors, Fred Van Dyke and Rachel Lamb, draw on their expertise as

field biologists, wildlife managers, consultants to government and industry, and scholars of environmental law, policy, and advocacy, as well as their many years of effective teaching experience. Informed by practical knowledge and acquired skills, the authors have created a work of exceptional clarity and readability which encompasses both systemic

foundations as well as contemporary developments in the field. Conservation Biology: Foundations, Concepts, Applications will be of invaluable benefit to undergraduate and graduate students, as well as to working conservation scientists and managers. This is an amazing resource for students, faculty, and practitioners both new and experienced to the field. Diane

Debinski, PhD Unexcelled wisdom for living at home on Wonderland Earth, the planet with promise, destined for abundant life. Holmes Rolston, PhD Van Dyke and Lamb have maintained the original text's emphasis on connecting classical ecological and environmental work with updated modern applications and lucid examples. But more importantly, the third

edition contains much new material on the human side of conservation, including expanded treatments of policy, economics, and climate change. Tim Van Deelen, PhD Fred Van Dyke and Rachel Lamb break new ground in both the breadth and depth of their review and analysis of this crucially important and rapidly changing field. Any student or other reader wishing to have a

comprehensive overview and understanding of the complexities of conservation biology need look no further – this book is your starting point! Simon N. Stuart, PhD Anyone who teaches, talks or writes and works on Conservation Biology, needs this latest edition of Conservation Biology (Foundations, Concepts, Applications, 3rd edition) by Fred Van Dyke and Rachel L. Lamb. This will be useful to

both beginners and experts as well. The authors included almost all important issues in relation to conservation biology. This is really an outstanding book. Frontiers Media SA The seventh volume in the series “Ethology and Behavioral Ecology of Marine Mammals” describes aspects of the often-complex relationship between humans and marine mammals. From a primeval condition of occasional predators, during the last century humans have become a major factor negatively affecting the status of most marine

mammals through over-hunting, habitat encroachment and environmental degradation. This has led to the extirpation of many marine mammal populations and even to the extinction of species. However, in parallel to this destructive drive, since antiquity humanity has been influenced by a strong fascination for marine mammals, which contributes today to an increased human appreciation of the natural world admixed with widespread concern for its degrading condition. The special status occupied by marine mammals in human imagination and affection stands in stark contrast with the current predicament of many populations still threatened by the doings of Homo sapiens: a condition emblematic of the relationship of humanity with nature, and key to understanding where humanity is heading.
